Ex.No:9 File handling in PHP

26/09/2022

(1) A company wants to maintain the entire employee's record in a file, where the employee's details should have employee id, Name, Qualification and designation. Develop the form that reads the inputs from the employee and store it into a file named "employee.txt" and display the information in a neat format. Copy the file into another file. Rename the copied file.

(2) Write a PHP program to read the inputs mentioned in (a) to (d) using suitable form components, compute and write the extra bonus points into the file after pressing the submit button. Read and display the same in the web page. Also upload the file into the server.

a. Input the account number.

b. Read the initial balance of the month.

c. Read the total items charged by the customer for a month.

d. Read total credits applied to the customer's account for a month.

Calculate the extra bonus points as per novel/new rule mentioned in this problem below:

(1). Add 30% of the total items charged (c) and 20% of the total credits applied (d)

(2). Find the square root of the initial balance (b)

(3). Subtract the square root of the initial balance from (1) and display the extra bonus

   points.

Note: Use suitable mathematical functions wherever applicable.
